ACCUMULATOR

Our Sleeveit Accumulator is a specialized machine designed for high-speed production lines that require consistent output without interruption due to container accumulation. It is capable of storing 50 or 100 meters of sleeve material, depending on the specific needs of the customer.

INTEGRATED SOLUTION

An integrated solution is available by combining our Sleeveit Accumulator with a stand-alone Twin Spool Sleeve Unwind System and splice table. This provides the operator with enough time to splice a new reel of sleeve material to the end of the old reel while the sleeve material already in the Accumulator continues to feed into the sleeve applicator. Once the splice has been made, the Accumulator will refill automatically. The electrical requirements for this system are 230 vac, 1 phase, and 1.2 amps.

At BW Integrated Systems, we offer a wide range of sleeving system solutions, including Sleeve and Label Applicators, Electric and Steam Shrink Systems, and Container Handling Devices. Our Sleeveit Accumulators are just one part of this range.

FEATURES

- Suitable for high speed lines
- Designed for nonstop production lines
- Provides the ability to splice on the fly
- Stores either 50 or 100 meters of material
